Introduction

Problem

How can we use microchips to turn on objects by asking an AI to do it? What if we're too hot and want to be cooled down?

Background

By learning STEMSEL, you can learn to program microchips to tell them what to do. Microchips can monitor devices and warn people like when your laptop battery is low, and you need to plug the cable in. However, they can also control people's behaviour more directly, such as electronic road signs and traffic lights. But the microchips must send the right message; otherwise there can be problems like turning on the green lights at the same time.

By using runlinc, we can create an AI to do the things we ask it to do or even have conversations with it. By using AIs, we can help streamline what?

Ideas

Look at the STEMSEL controller board. Can you see any inputs, i.e. something that we can touch or change to tell the microchip something? What about an output, i.e. something the microchip can change to tell us something? What kind of inputs and outputs are generally on an alarm system? What outputs can we use for our AI can use?

Plan

So, we want the runlinc AI to be able to talk to us and others. First, we are going to need a way to talk to our AI. We'll also need to give our AI information so it can talk and give responses. To do these, we'll have to create an input through our webpage, which will allow our AI to talk to us.

OUTPUTS

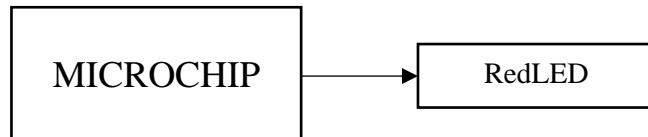

Figure 1 Block diagram of Microchip Outputs

Runlinc Background

Runlinc is a web page inside a Wi-Fi chip. The programming is done inside the browsers compare to programming inside a chip. The runlinc web page inside the Wi-Fi chip will command the microchips to do sensing, control, data logging Internet of Things (IoT). It can predict and command.

Part A: Design the Circuit on runlinc

Note: refer to runlinc Wi-Fi setup guide document to connect to runlinc

In our circuit design, we will be using the RedLED. We happen to have this in our kits, so it can be used on our circuit design, as per the plan.

On the runlinc webpage remember to type in a name for the equipment we are using

For port C4, name it RedLED and set it as DIGITAL_OUT

The screenshot shows the runlinc V1.1 web interface. At the top, there are sections for 'File' (Load File, Save) and 'Board' (Send, Get, Run Code, Stop Code, Board IP: http://192.168.1.60). Below this is a dropdown menu set to 'STEMSEL'. The main area is a table titled 'STEMSEL' with columns for PORT, CONFIGURATION, NAME, and STATUS. The rows represent pins A3, B4, B6, C0, C1, C2, C3, C4, C5, and C6. For each row, the 'CONFIGURATION' dropdown is set to 'DISABLED' except for C4 which is set to 'DIGITAL_OUT'. The 'NAME' column contains the value 'RedLED' for C4. The 'STATUS' column for C4 is red and displays the word 'OFF'.

PORT	CONFIGURATION	NAME	STATUS
A3	DISABLED		
B4	DISABLED		
B6	DISABLED		
C0	DISABLED		
C1	DISABLED		
C2	DISABLED		
C3	DISABLED		
C4	DIGITAL_OUT	RedLED	OFF
C5	DISABLED		
C6	DISABLED		

Figure 2. I/O Configurations and Connection

Part B: Build the Circuit

Use the runlinc I/O to connect the hardware. Remember that black wires connect to the negative port (-), red wires to the positive port (+) and white wires connect to the pin designated in the circuit design.

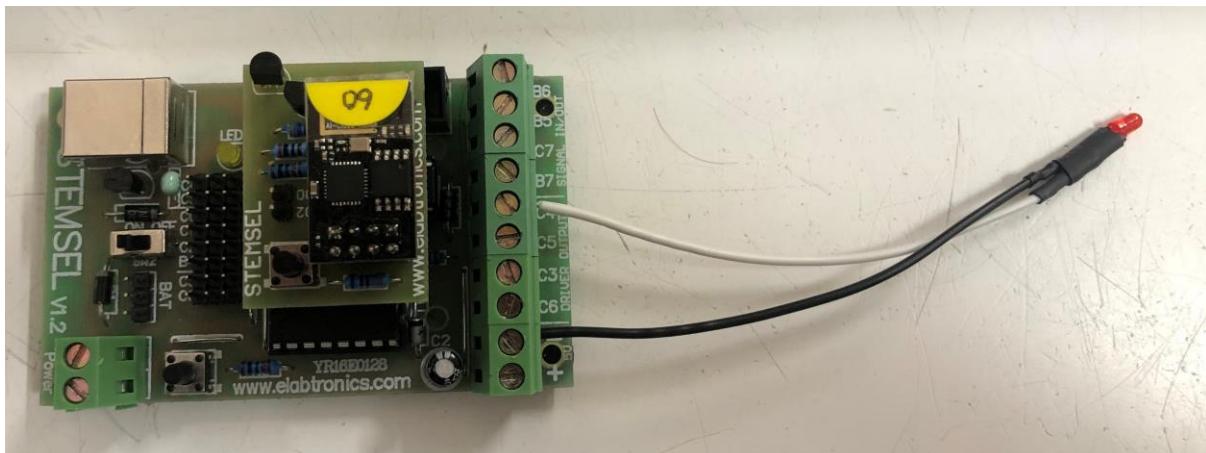

Figure 3 Circuit connection with microchip

Wiring Instructions

- Connect the white wire of the RedLED to C4
- Connect the black wire to the negative port (-)

Part C: Program the Circuit

Use the blocks on the right side of the runlinc webpage to program the functions of the traffic light. Use the HTML to add contents, CSS to add style to your taste and Javascript to program the microchip. For this case, we will be using HTML and JavaScript to program our AI chatbot.

After naming the port C4, we are going to program the circuit. First, we need HTML block to add in the graphics for what we are going to do.

In this step, we'll need to give our webpage a title first, let's call it, My runlinc AI ChatBot. To do this, we'll need to use the Heading tag <h3>.

```
<h3>My runlinc AI Chat Bot</h3>
```

After we have our title, we need to create the text box and a text line saying what it's for. To do this, we will use the paragraph tag <p>.

```
<p>Chat to runlinc AI BOT. Type your text...</p>
```

Now that we have set up the text sections, we need to add an input text field for a user to type in their conversations.

```
<input type="text" id="myText" value="type here...">
```

Next, we need a button to send what has been typed inside to the AI. Thus, using the button tag:

```
<button onclick="myFunction()">send</button>
```

Make sure to put in a space between the different sections using the
 tag at least 3 times to give a good gap.

Now that we have created our input field, we need to create our output field so the AI can respond. First, we should make sure that it's clear that the AI is talking, to do this we'll type in:

```
"runlinc AI says..."
```

Make sure to exclude the “ for what you just typed.

Now put in another small break by using the
 tag.

Then we can put in the output for the AI:

```
<p id="replyText"></p>
```

Now that we have set up all the inputs and outputs, we can now look at creating our AI.

To do this, we'll need to use the JavaScript block.

To start with, we will create a function called myFunction and declare a variable called x:

```
function myFunction() {  
    var x = document.getElementById("myText").value;
```

Now that we have set up the variable, we can give responses to our AI. To do this, it will need to receive what has been typed, then compare it with what it is expecting, which will allow it to give a response.

```
var n = x.includes("Hello");
if ( n == true ) {
  x = "Hello to you too!";
  turnOff( RedLED );
}
```

In above, we have set up the AI to respond to somebody who said Hello to it. Now we can give some more functions. Let's say that the AI is in danger and that it will then light up the RedLED when it is.

```
var n = x.includes("danger");
if ( n == true ) {
  x = "Oh now I'm scared";
  turnOn( RedLED );
}
```

Now we should tell it to relax, meaning it's no longer in danger.

```
var n = x.includes("relax");
if ( n == true ) {
  x = "OK Thanks. That was close.";
  turnOff( RedLED );
}
```

Now that we have created a basic AI, we need the code the JavaScript to communicate with the HTML. To do this we need to use the innerHTML method:

```
document.getElementById("replyText").innerHTML = x;
}
```

Final Result:

runlinc V1.1 Copyright and International Patent Pending. All rights reserved.

The interface includes a top navigation bar with File, Board, and CSS/HTML tabs. Below is a table for port configuration and a code editor showing the generated HTML code. The table shows port A3 through C7 all set to DISABLED. Port C4 is configured as DIGITAL_OUT and is currently OFF. The generated HTML code includes a header, a text input field, a send button, and a reply text area.

PORT	CONFIGURATION	NAME	STATUS
A3	DISABLED		
B4	DISABLED		
B6	DISABLED		
C0	DISABLED		
C1	DISABLED		
C2	DISABLED		
C3	DISABLED		
C4	DIGITAL_OUT	RedLED	OFF
C5	DISABLED		
C6	DISABLED		
C7	DISABLED		

Network Status: Active

```

<h3>My runlinc AI Chat Bot</h3>
<p>Chat to runlinc AI BOT. Type your text...</p>
<input type="text" id="myText" value="type here...">
<button onclick="myFunction()">send</button>
<br> <br>
runlinc AI says...
<br>
<p id="replyText"></p>
|
```

        turnOff( RedLED );
    }

    document.getElementById("replyText").innerHTML = x;
}
```

JavaScript Loop Select Macro select a device Add Macro

Figure 5 JavaScript code

For **HTML** the code is:

```
<h3>My runlinc AI Chat Bot</h3>
<p>Chat to runlinc AI BOT. Type your text...</p>
<input type="text" id="myText" value="type here...">
<button onclick="myFunction()">send</button>
<br> <br> <br>
runlinc AI says...
<br>
<p id="replyText"></p>
```

For **JavaScript** the code is:

```
function myFunction() {
    var x = document.getElementById("myText").value;
    var n = x.includes("Hello");
    if ( n == true ) {
        x = "Hello to you too!";
        turnOff( RedLED );
    }
    var n = x.includes("danger");
    if ( n == true ) {
        x = "Oh now I'm scared";
        turnOn( RedLED );
    }
    var n = x.includes("relax");
    if ( n == true ) {
        x = "OK Thanks. That was close.";
        turnOff( RedLED );
    }
    document.getElementById("replyText").innerHTML = x;
}
```

Extensions

Now that we have created the core code, we can now look at expanding it to do more than just talk.

The first challenge is to make it have a full conversation with you or somebody else, even turning on and off other devices like a fan. You can achieve this by copying and pasting the code from one of the var declarations and changing the expected input and outputs to whatever you want.

The Second Challenge is to get the AI to talk. Here a segment of code that could help:

```
speech = new SpeechSynthesisUtterance("Here is a square.")  
window.speechSynthesis.speak(speech);
```

The Third challenge is to get it to draw shapes when it's asked to. To give you a hand, here is a small section of code that might just help (goes in the JavaScript Block and place this piece before `document.getElementById("replyText").innerHTML = x;`):

```
if (x.includes("square")) {  
    speech = new SpeechSynthesisUtterance("Here is a square.")  
    window.speechSynthesis.speak(speech);  
    x = "Here is a square.";  
    var canvas = document.getElementById('canvas');  
    var ctx = canvas.getContext('2d');  
    ctx.strokeStyle = 'black'  
    ctx.beginPath();  
    ctx.strokeRect(520,0,100,100);  
    ctx.stroke();  
}
```

And this line of code should go into the HTML block:

```
<canvas id="canvas" height=1000 width=1000></canvas>
```

Summary

People can use programming to tell AI what to do. However, sometimes those AIs can be programmed to have conversations with people, so it is important to program them correctly. In this project, we learned that we can make an AI talk to people and turn on and off devices.
